(not only)

Hair [^] Defines your Look, Confidence too.

- › Looks do matter, and hair matters to your look.
- › Receding Hair line, bald face eats up the facial symmetry. An Imperfect symmetry often leads to diluted look.
- › Restoring Hair is not only a matter of look, but a way forward to Confident Head.

Why Me What Went Wrong

Hey don't feel you are alone in this agony of Hair loss, termed as Male pattern baldness. 60-70% of male across globe experience this at varying point of age. The key lies in your heredity, primarily. Males with baldness in their family, are more prone to pattern Baldness. With every passing generation the genes are getting stronger. Modern lifestyle leading to stress, smoking, poor nutrition plays a trigger element.

Research has found that male pattern baldness is associated with male sex hormones called androgens. The androgens have many functions, including regulating hair growth.

Each hair on your head has a growth cycle. With male pattern baldness, this growth cycle begins to weaken and the hair follicle shrinks, producing shorter and finer strands of hair. Eventually, the growth cycle for each hair ends and no new hair grows in its place.

When it Onsets, *don't lose hope.*

Your hair loss begins at the temples or the crown of the head. Some men will get a single bald spot. Others experience their hairlines receding to form an "M" shape. In some men, the hairline will continue to recede until all or most of the hair is gone. A typical baldness is classified on Norwood-Hamilton Scale.

You may have trouble accepting your appearance. You should seek counseling if you experience anxiety, low self-esteem, depression, or other emotional problems because of male pattern baldness. At the same time Surgical and Non surgical intervention plays a vital role in hair restoration. Choose an expert and ethical counseling you can bank upon.

Answers

to your hair loss

Treatments or solutions are subjective to individual's Grade of baldness as well as their expectations / objective.

Male experiencing hair thinning coupled with hair line recession?

It could be just an onset of Male pattern baldness and a potential to expand. Arresting hair loss at early stages occupies the first line of action. One should consult a physician for Prescription, usually consisting of medicines, and PRP.

Hair loss progressed to an extent of visible baldness?

Hair Transplant remains the main stay for natural and permanent look when baldness grade to III -VII of Norwood Scale. Traditional Hair Transplant method FUT, popularly known as Strip Method gives a good result. Because of its invasive nature leading to slower recovery time, minimally invasive method FUE is fast becoming a popular choice.

Baldness is visible, and the person wants quick fix look restoration?

Male reluctant or not qualified for a hair transplant, natural looking human Hair system comes as rescue for look restoration

Science of Hair Transplant

Hair Transplant is a surgical procedure to cover the bald areas of the scalp. In this surgery, permanent roots or follicle are taken out from the back of the scalp, or beard or body hair sometimes, and planted in the bald areas of the head. Slowly, these roots sprout new and naturally growing hair. It is a minimally invasive procedure which is relatively safe and hassle-free if done properly.

A good transplant experience a combination of method and craftsmanship, as well. Methods are classified, on the basis of how the follicles are harvested from donor scalp, as FUT and FUE, broadly.

FUT *(Follicular Unit Transplantation)*

Strip method of hair transplantation is another effective method used in hospitals for growing hair. It is not as bad as other clinics depict it to be. Though there are a few shortcomings of this method as considered against the FUE procedure, yet it does have certain advantages as well.

In this method of transplantation, a streak of skin is removed from the main source (where the hair are dominant) and then the hair grafts are separated from it and transplanted on the area where the individual wants the hair to grow. The area from where the hair were originally extracted from, are stitched with the help of sutures. This takes a couple of weeks to heal. After two weeks or so the cut is entirely healed, the procedure leaves a scar which will only be visible when an individual completely plans to get his head shaved. The most prominent disadvantage of this procedure is lesser yield than FUE hair transplant technique or Perfect-i technique. The wound also takes a lot of healing time but nonetheless it is much faster and cheaper than Follicular Unit Extraction procedure and can be considered if you wish to go for economical hair transplantation.

FUE *(Follicular Unit Extraction)*

Follicular unit extraction (FUE) which is also called Follicular Unit Separation & Extraction (FUSE) method or follicular transfer (FT), is a surgical procedure for obtaining follicular units. Mostly 1-4 hairs are easily taken out in this procedure for hair transplantation. In FUE technique, individual follicular units are obtained from the patient's scalp where the hair are still present. This procedure is different from strip method since in strip method, a piece of skin(that contains hair follicles) is surgically removed from the patient's scalp and then transplanted into various areas that have gone bald. With advancement in technology, FUE method has transformed itself into Advanced FUE. Advanced FUE has increased the possibility of obtaining hair follicles not only from the head but also from chest, legs, arms, abdomen, back, face, and beard.

Perfecting the Art with Science of Hair Transplant

PERFECT-i

It stands for Permanent and Real-time Follicular Extraction and Implantation. The latest innovation in hair restoration Hair Transplant by MedLinks. In this technique Hair Follicular units are harvested one by one (like FUE Hair Transplant) using automated instruments. The Harvested Follicles are immediately implanted back into the bald areas within a few minutes. There is no storage of follicles unlike conventional FUE Hair Transplant or Strip Hair Transplant.

Research has shown that there is approximately 2% graft death per hour of storage and much

more if the storage time crosses 6 hours. In PERFECT-i, the storage time is minimal, thereby ensuring no follicle death. In this technique, it is made sure that the follicle is not held at the root or the bulge area which ensures graft survival and quality. At MedLinks, the graft harvesting is rapid and precise. The transaction rate is consistently below 2%. In some cases we have achieved a transaction rate of less than 1%. Internationally accepted standard for transaction in FUE Hair Transplant Surgeries is around 10-15%. Our experience and expertise offers a huge advantage over conventional FUE Hair Transplant Surgeries at other centers.

Why MedLinks for #ConfidentHead

Team Matters & Experience Counts

To transform into a confident head you need to bank on confident Team of Qualified surgeons and seasoned hands. The surgeons from Premier Medical Institutions Like AIIMS with an experience of 4500+ hair transplants ensure promising results.

Quality Assured

Believing on philosophy of "Quality Above Par", and entire process is designed to meet the same. The Quality Assurance cell regularly monitors the patients satisfaction and the address the gap, if any, with zero tolerance.

Nothing but Result

Hair Transplants is a result oriented surgery. A fair track record of good results ,even in challenging cases gives us the strength to promise a good results.

Efficient Patient Support

A responsive support professional makes your journey comforting. Pro patient pricing ,Financial support of No cost EMI, prompt post care services are few to count.

Challenging case

#ConfidentHead

Burnt scarred case

Failed case of hair transplant, scarred skin

Correction of bad hairline

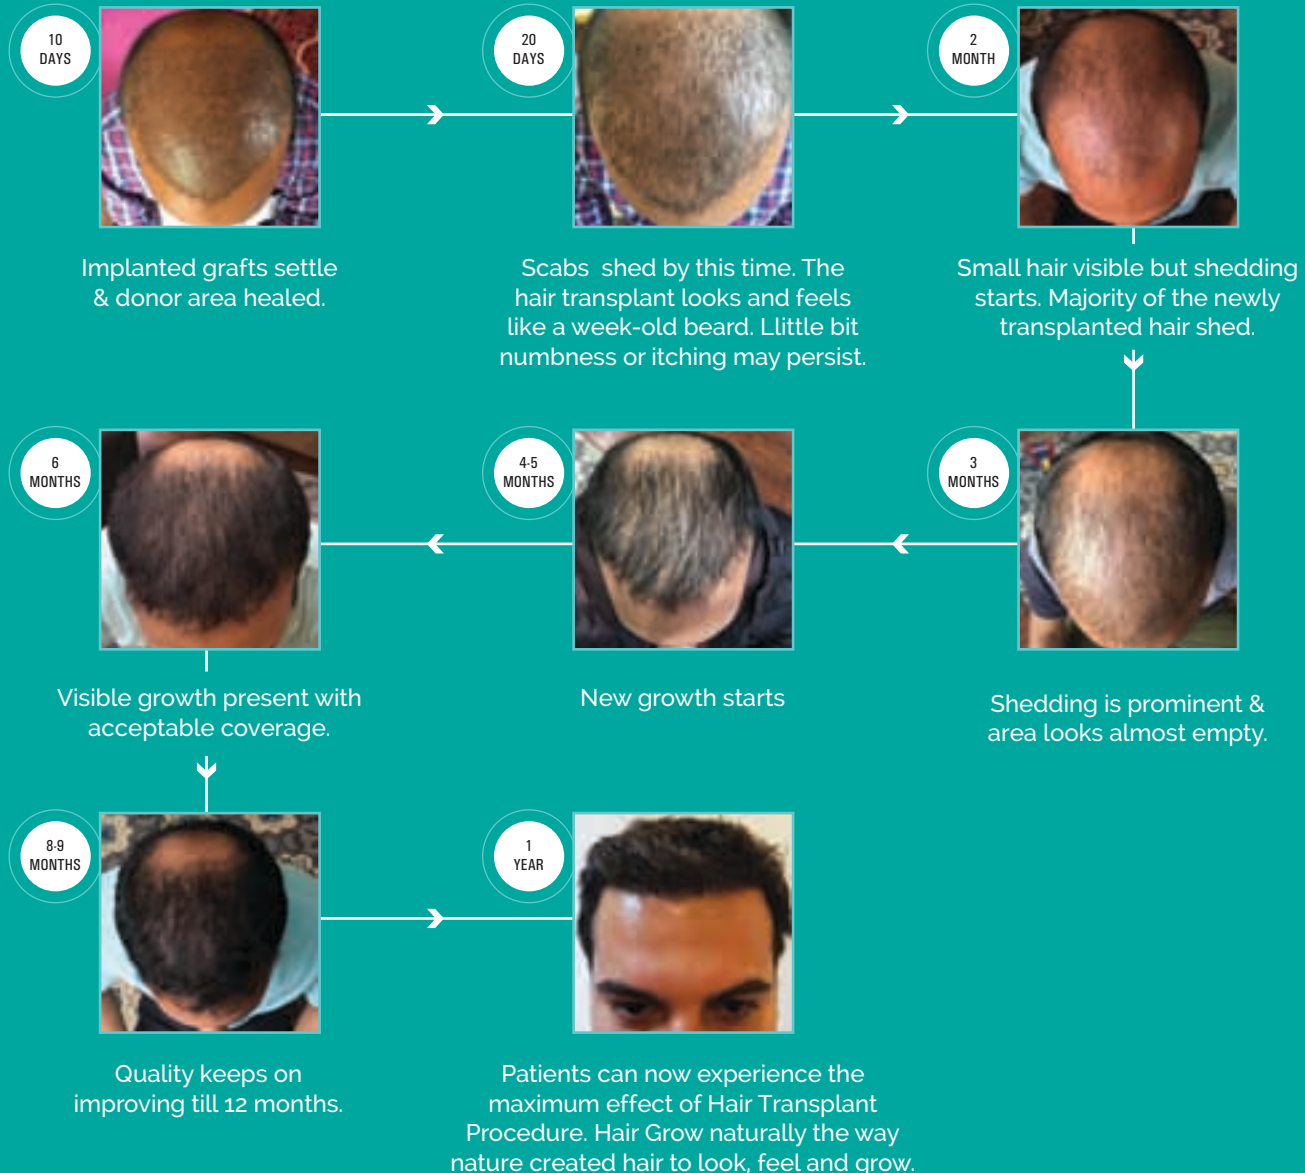

Failed case of hair transplant, exhausted donor

FAQ's

Does a hair transplant hurt during or after the procedure?

As said earlier, hair transplant is a minimally invasive procedure done under local anaesthesia. The only painful part is the anaesthesia injection – and that is a very mild discomfort, and even less so with experienced hands and correct technique. Most patients rate the surgical pain 2 on a scale of 1 to 10 – with 1 being not painful and 10 extremely painful.

Does hair transplant leave scar? Is it safe for everyone?

It leaves a minor scar and, if the surgery is done properly, that is not visible to the naked eye. The procedure is safe and result-oriented under experienced hands with good technology/infrastructure.

What is FUE hair transplant treatment? Is it permanent? Does it help grow new hair?

FUE is the most popular hair transplant technique. It stands for Follicular unit Extraction. The results are permanent and it grows new hair on bald areas of the head.

How many sessions are required for a hair transplant procedure?

Usually one or two sessions are enough to cover the entire scalp. A typical session of approximately 8,000 hair threads covers half the scalp.

Does a hair transplant have any side effects?

It is a fairly safe procedure. Minor complications like swelling and mild pain might be there in the first week. It doesn't affect the brain, eyes, etc. However, if performed by inexperienced hands, problems like long-term pain, infection, anaesthesia complications cannot be ruled out.

For how many days does one need to be away from work? Is it safe to go outside immediately after the treatment?

It is mandatory that you stay away from work for at least three days, as the wounds are fresh and your head has to be covered by a surgical cap. After three days, a normal cap might be used and the person could resume office. Work from home is possible from the next day itself. It is best to stay indoors for two days after the transplant.

What's the cost involved in a hair transplant procedure?

The cost varies depending on technique and grade of baldness. Typically, a one-day session for the FUE technique involving roughly 8,000 hair threads would be Rs 125,000 to Rs 150,000 at a reputed clinic.

Aiming to be in the leagues of #ConfidentHead

How to Proceed

- ✓ A personalized counseling is done to know the Medical history, understand patient expectation, donor area strength and to prescribe relevant/mandatory blood tests.
- ✓ The surgery starts in morning around 10:00 am and ends by 04:00 pm depending upon number of grafts required. Patient may have light snacks, juice or tea in short breaks. Lunch after the procedure. Patient leaves the clinic with a light bandage at donor area and surgical cap.
- ✓ Post Surgical Care Patient has to adopt a Take it easy approach for the next 2 days. Normal work may be resumed after 48 hours. Bed Rest is Not Required. Heavy Physical activity is restricted for 15 days at least.
- ✓ Post Surgical Evaluation after 10 days is recommended, outstation patient can have a follow up Via Skype-FaceTime-Google timeout- Whatsapp-Viber.
